Chapter 1 Structure

I. Lecture framework

1. Start from the Outline

(1) Use lecture topics as the main structure; **keep the source scope**.
(2) **Definition:** short explanation with the essential condition.
① First supporting point with a concise explanation.
② Second point at the same logical level.
③ Keep labels and conditions easy to find.

2. Emphasis

Term: regular English explanation; **deciding condition** in red bold.
Use concise annotations only when they improve clarity.

II. One topic, direct points

1. No repeated title when there is only one topic.
2. Numbering follows the actual relationships.
3. Same-level points use the same level.

Chapter 2 Code

I. Syntax and explanation

1. Editable templates

(1) **Example:** fixed syntax and replaceable names.
① Syntax:

```
SELECT column_name
FROM table_name
WHERE condition;
```

② Black: fixed syntax. Gray: names, parameters and values.

2. A method core

Method 1 — **core token:** brief idea, then code.

```
SELECT MAX(value) FROM table_name;
```

Only the distinguishing token uses pale-blue text.

II. A short template

(1) **Renaming:** a simple definition can lead directly to code.

```
SELECT column_name AS output_name
FROM table_name;
```

Chapter 3 Small Symbols

I. Inline native Word shapes

Height: 5.2 pt; stroke: 0.40 pt; editable groups.
Entity: 
Attribute connection:
Relationship connection:
One / arrow:
Many / line:
Total / double line:
Partial / single line:
Key underline:
Weak entity:
Identifying relationship:
Discriminator:
ISA:
Total ISA:
Partial ISA:
Composite:
Multi-valued:
Derived:
Full examples use source screenshots when labels and topology matter.
Keep double lines and dashed outlines distinguishable.
